

DESIGN THINKING

CAT-1 ASSIGNMENT

PROBLEM STATEMENT

- **Students often loose their belongings in the vast college campus.**
- **Finding it again takes quite the effort**
- **Brute force searching is not always a preferable option**
- **Therefore, there must exist a system where students can report items they find in random places, while the person who lost it can get to know about it through the same system, in a much more reliable manner**

HOW OUR PROGRAM WORKS

- 1) Our program allows a passer-by to report a found item and provides the owner with a robust search engine to locate it.
- 2) The reporter can submit details of the found item, including the area, approximate date and time, descriptive tags, and a picture of the item.
- 3) The searcher can enter the approximate area, date, and time of losing the item. They must select relevant pre-existing tags from the available list and can also add their own custom tags.
- 4) The search engine analyzes the provided details and tags to identify potential matches and displays the matching reports in order of relevance.

FILE STRUCTURE

FUTURE ENHANCEMENTS

- 1) 1. The application can be developed into a web or mobile application for easier access across different devices.
- 2) 2. An advanced image-matching system can be implemented to compare uploaded pictures and improve the accuracy of search results.
- 3) 3. Notifications can be added to alert users when a potential match for their lost or found item is identified.
- 4) 4. Location-based searching can be introduced using maps and GPS to improve the accuracy of area-based matching.
- 5) 5. User authentication can be added to provide secure accounts and protect user information.
- 6) 6. The search algorithm can be further enhanced using machine learning to provide more accurate and intelligent matching.

THANK YOU
